

Measuring a radius for a spa cover

Use a carpenter's square to measure the distance from the beginning of the curve (B) to the point where the opposite side of the corner forms a right angle (A).

If you don't have a carpenter's square available, you can also use a large piece of paper (pink highlight). Simply lay it under the spa, lining up the edges of the paper with the edges of the spa. Measure from the point where the paper leaves the edge of the cover to the corner of the paper.
